INDIANAPOLIS, SUNDAY MORNING, JULY 13, 1902.

PRICE FIVE CENTS.

## SEEK RELIEF IN DRUGS

THERE ARE MANY USERS OF THEM IN INDIANAPOLIS.

Various Ways in Which the Habit of Taking Morphine, Cocaine, Etc., is Contracted.

## PHYSICIANS ARE NOT IMMUNE

IN FACT, THEY ARE FREQUENTLY VICTIMS OF DRUG HABIT.

The Nature of Their Calling Makes It Easy for Them to Acquire the Pernicious Appetite.

The greatest curse that has a hold on a large part of humanity is the drug habit. The practice of using drugs has become so common in the last few years that the number of those who are addicted to the use of liquor is comparatively in the minority, and all of the late statistics will bear this statement out. It seems that the majority of people who have acquired the drug habit are to be pitied more than blamed because it can generally be attributed to some careless doctor or severe suffering from some deadly disease. In fact the number of people who keep themselves under the influence of poisons, for all drugs that deaden the senses are that, becoming so common that only an expert can tell them. It is undoubtedly true that most everyone could find that any number of his acquaintances whom he least suspects are confirmed drug users. It is said that is why the habit is even worse than the using of liquor, because a person who makes the use of any of the drugs to the habit can be told at a glance, while the drug fiend can't. Another thing is that people who are addicted to alcohol generally become so through good-fellowship, while the person who uses drugs is very secretive about it and takes his dose of morphine or cocaine in some dark corner where he is not observed.

It is in the cities where the drug fiends are almost exclusively found. There are few of them among country people, who, on account of outdoor work and plenty of fresh air and nutritious food, are much healthier than their city-bred fellows. While the larger the city the more drug users are to be found, there are enough in the smaller towns. Indianapolis, of course, hasn't as many as a city like Chicago, but in proportion it will equal any of them. All the private sanitariums and public institutions for the treatment of the sick have more or less of these drug users in them all the time. The thing that now confronts the people of this country is to stamp out the habit, which is wrecking more lives than any other. Physicians all agree that if something is not done in this line in the next few years, the habit increasing as it has, the results will be serious.

**DRUGS MOSTLY USED.**

The drugs mostly used by these people are morphine and cocaine. In fact, the case is very rare where it is found that a person is ever addicted to the use of any other. The morphine habit, which is the most common, is, as all other habits, more easily contracted than got rid of. It is usually brought on through some careless physician or on account of its popular known effect. It is seldom that a person does not know the effect of morphine or cocaine, while with gum opium, which is popular among the Chinese, and other drugs of that nature, the effect is not generally understood except by those who are familiar with drugs. It is usually contracted by persons who are chronic users of alcohol never not to be satisfied with it after a time and begin to use morphine instead. This is also the case when men are just getting over long debauches. They take morphine to relieve extreme nervousness and finally become habitual users of it. The fact remains that men who drink heavily are often morphine fiends as well. It is also frequently found where people are suffering from chronic diseases that, to relieve the acute pain which is subject to, they will use the drug to such an extent that they become confirmed in the practice before they fully realize that they can't get along without it. This is principally true of women, who lend themselves more easily to the drug habit than do men. It is claimed that nearly all persons afflicted with cancer take morphine in large quantities to relieve the acute suffering which this disease causes. In many cases where it is found that the patient is incurable, the physician put him on this to give what relief can be derived from it.

The most curious fact, however, is that a majority of what are called geniuses, or men of peculiar and extraordinary turns of mind, are addicted to morphine and cocaine. This can be said of a large percentage of men and women who live by their brains and have a more or less bohemian side to them. Some of our best writers and most remarkable men in the mechanical world have been slaves to this habit on account of excessive brain work. This class generally labor in periods. That is, they will conceive an idea and work while the spell is on for two or three days without taking sufficient rest or nourishment. Then when the working fever has left them and they have accomplished their task they become exhausted, their nervous systems are all unstrung and they suffer from insomnia. To overcome this they begin by taking small doses of morphine, but soon their systems become so saturated that they require larger doses, and finally they are in no wise different from any other fiend who devotes his life to the drug. The other class of people who use morphine are exceedingly dissipated and are of a very nervous temperament and like excitement. The cause for this class using it is the same as that which actuates the genius. They both can keep up under the strain to which they are subject for a certain time, after which their nerves go to pieces and they suffer from insomnia and other nervous disorders which are only influenced and quieted by the use of drugs.

**OUT OF CURIOSITY.**

It would be surprising if it was only known how many people become slaves to this habit out of curiosity to see what its effect on them would be. From this fact every one should take warning and never try anything of the kind, for when the practice becomes so saturated that they require more money or medical aid to relieve the victim. After these curious people try morphine they become so satisfied with its effect while under its influence, and so dissatisfied when not, that they continue the practice. Statistics show that there are

more women addicted to taking morphine than men, and the majority of them is of the very lowest order of society. Cocaine, the drug that causes the "Queen of Bavaria" to visit one, is the next in popularity to morphine. It is mostly used by negroes and is quite common throughout the South. The reason that it is used more by this class than morphine is because more pleasure is derived from it. Morphine is generally taken with some object in view, such as for insomnia or for the quieting of pain. Cocaine is not used for these purposes by physicians because it doesn't put one to sleep and does not relieve pain for any length of time. All the users get out of it is a sensation of languid dreaminess, during which there are visions of all kinds of heavenly things floating before them, which immediately change to the reverse when the power of the drug wears off. A careful physician is very cautious about the way he administers and prescribes such drugs, and well he should. Of the incompetent doctors, it is said, where a patient is suffering from some acute disease, to prevent being called at night to administer a narcotic, will leave the tablets and tell the patient to get his own hypodermic syringe. After he has learned what the drug is and the effect it has on him he will continue using it. The fact is, according to the statements of doctors, they all use more morphine, cocaine and opiates of every description than is generally supposed. They have found that there are no drugs that contain the same properties as these, and there are no others whose results are more satisfactory in a purely medical sense. So if the patient is left in ignorance of what he is taking he may be relieved of much suffering, and, after recovering, will be none the worse for the experience.

Many people after recovering from an illness where they have used their own hypodermic syringe will keep up the practice of taking morphine in this way, but it is not popular among fiends. Each time the syringe is thrust under the skin it leaves a little sore about the size of a pin-head, which may turn into an abscess and if care is not taken prove serious. Doctors say that it is often the case where they find morphine fiends who take the drug with the syringe they are covered with abscesses from their shoulders to their feet. The popular way of taking it is to swallow it. Morphine comes in small cubes and the users of which who think it is a sufficient amount, and those who have used it for a long time are very accurate in guessing the right dose. They place this on the tongue and swallow it.

**HABITUAL USERS.**

The strange thing with the fiends is that they keep themselves under the influence of the drug all the time, instead of at intervals, like those who use alcohol. Physicians say the first effect it has on these constant users is to deaden the senses. Then comes the state of good-fellowship, when they feel at peace with everything in the world. Their imagination becomes very much excited and they think that they are very rich and earn large sums of money each day. They also speak about the great things that they have accomplished and their capacity for work is increased until they can do about two men's share. But when the effect of the morphine wears off then the suffering begins. All of the visions of being rich have disappeared and they realize that they are in poverty, which is generally the case. And instead of being able to do two men's work they are unable to do their own. They are also so weak that they can't sometimes walk across the room, but as soon as another charge of the drug is taken and they become again "doped up" they feel as though they are equal to any task.

It is when not under the influence of the drug that the fiend is miserable and becomes crazed. It is said that during this time all of his misfortunes come upon him doubly strong and that his only relief is in more morphine. It is during this awakening that he will do anything to get it. There have been a number of cases where these people have committed murder to procure the means to buy morphine with. There seems to be a great craving of the whole system. Where while under its influence they were able to go without food for two or three days and abstain from water very nearly as long, now the senses of thirst and hunger are very keen and they can eat and drink large quantities. In place of being congenial they are now irritable, and woe be to the person who happens to arouse their temper.

The average dose of morphine to deaden the most severe pain is one-fourth of a grain, and the largest ever given is one grain, which is sufficient to kill some people. To the chronic user of the drug, this would be a very small dose, but for the average of this class take sixty grains per day, while those who have used it for a number of years take 120 grains in the same length of time, which is enough to kill sixty men who are unaccustomed to its effect. As most of the chronic users commence the practice from sleeplessness, it takes exceptionally large amounts to put them to sleep. The fact is, the morphine fiend does not get as much sleep as the average person at any time. Doctors say that the reason these people can endure such large doses is that their systems become so accustomed to it that it requires great amounts to have the desired effect. They say that it is the same with tobacco. The first cigar a man smokes generally makes him sick, while if he continues the use of tobacco his system becomes so saturated with the nicotine that he does not feel the effect of three or four cigars a day.

**PHYSICIANS USE DRUGS.**

It is becoming so at the present time that physicians are the largest users of drugs. In fact the medical profession is beginning to recognize this state of affairs. In the report of an institution where the liquor and drug habits are treated it is shown that out of 100 patients, twenty of them are physicians, but it is true of all such places. It is found that doctors who take morphine to any extent are those of large practice, and it is the amount of work that they are required to do that makes them use it. A doctor is only human, and after going all day looking after a long list of patients he, of all men, needs a full night's rest, but this he seldom gets. After being called up two or three times a night and having to nerve himself for all kinds of things, he naturally becomes so nervous that when he does get a chance to sleep he can't without using artificial means. Physicians, of course, know the properties of drugs, and as they always are supplied, it is an easy matter to take a tablet to steady the nerves. The peculiar thing about morphine and cocaine is that neither of them unfits a man for work. In one of the largest business houses of the city one of the chief clerks uses morphine and keeps himself under the influence of it all the time. He is under the influence and his work is done as accurately as that of any of his associates. Of all the drugs that are employed as opiates chloral is the quickest to act. It is the drug that is used as "knock-out drops," as the police call it, and is often given in low doses when a victim is robbed. Thirty

The new British ambassador, the Hon. Michael Henry Herbert, whose piscatorial prowess is hardly less than his diplomatic ability, and his two sons, in readiness for a day's fishing.

grains of it dissolved and put in a glass of beer or whisky is sufficient to put a person in a dead sleep before he can get undressed. About the only people who habitually take chloral are men who are in the habit of going on long debauches. Another drug that has a peculiar effect on one is cannabis indica or Indian hemp. It has the same deadening effect as morphine, but instead of putting the patient to sleep it only makes him lapse into a semi-conscious state, during which all periods of time seem greatly lengthened. For instance, it will seem hours between the ticks of a clock. The influence of the Indian hemp does not last over half an hour, but to the patient it seems days. Why this drug acts this way physicians are unable to say. About the only place that it is used in institutions where the drug habit is treated, and is employed there in the place of morphine.

It seems that dark-haired persons are more susceptible to the use of drugs than those with blonde hair. It is well known that the passions of love and hate are much more pronounced in the brunette than in the blonde. The reason for this is that the nervous system of the person of swarthy skin is much stronger than that of the one with fair complexion. Physicians claim that they are also much more careful about giving narcotics to blondes than to brunettes, because what will hardly affect the one will, in most cases, prove fatal to the other. It may be stated here as a fact that the passions of love and hate are much more pronounced in the brunette than in the blonde.
